1 Introduction

Citation styles vary across academic disciplines. OmniLaTeX provides pre-configured wrappers for the most common publishers so you can switch styles with a single command.

As demonstrated by Knuth [KNUTH 1984], literate programming bridges the gap between human-readable documentation and machine-executable code. The BibTeX system [LAMPORT 1994] and its successor biblatex [KIME; LEHMAN, and WRIGHT 2020] provide powerful reference management. Section 2 describes the methodology, which builds on foundational work in software engineering [BROOKS 1995].

2 Methods

Our approach follows the structured methodology outlined in the classic text by Brooks [BROOKS 1995], adapted for modern open-source toolchains [KIME; LEHMAN, and WRIGHT 2020].

3 Conclusion

Switching citation styles is straightforward: change the `\citationstyle{...}` argument in the preamble and recompile.
