Outline

1. What is OmniLaTeX?
2. Key Features
3. Architecture Overview
4. Block Environments
5. Getting Started

What is OmniLaTeX?

OmniLaTeX is a universal $\LaTeX$ template system designed to simplify document creation across academic and professional contexts.

Core Idea

Write once, compile anywhere. OmniLaTeX provides a single template that supports 16+ document types with consistent branding and professional typesetting.

Built on KOMA-Script and compiled with LuaLaTeX for modern font and Unicode support.

Key Features

- Modularity** Each document type is a self-contained profile
- Typography** Consistent, professional typesetting out of the box
- Bibliography** Integrated biblatex with automatic citation management
- Code Listings** Syntax highlighting via the minted package
- Multi-language** Full polyglossia support for international documents
- Reproducibility** Docker and Nix flakes for deterministic builds

Architecture

Layered Architecture

The template follows a layered architecture:

1. **Core Layer** — Base class, utilities, colors
2. **Typography Layer** — Fonts, math, lists, typesetting
3. **Layout Layer** — Page geometry, floats, boxes, KOMA config
4. **Content Layer** — Document types, institution profiles
5. **Reference Layer** — Hyperlinks, bibliography, glossaries

Customization

Each layer is independently configurable, allowing users to override any aspect of the template without modifying core files.

Block Environments

OmniLaTeX presentations provide several styled block environments:

Theorem (Euclid)

There are infinitely many prime numbers.

Usage

Use `\begin{presentationblock}{Title}` for a standard highlighted block.

Important

Always compile with LuaLaTeX for full Unicode support.

Supported Document Types

OmniLaTeX supports 16+ document types:

- Thesis / Dissertation
- Technical Report
- Journal Article
- Conference Paper
- Book / Manual
- CV / Resume
- Cover Letter
- Standard / Patent
- Poster
- Presentation
- Letter
- Dictionary
- Inline Paper

Getting Started

Minimal Example

```
\documentclass[doctype=presentation]{omnilatex}
\title{My Talk}
\author{Jane Doe}
\begin{document}
  \maketitle
  \begin{presentationframe}
    \slidetitle{Hello World}
    Content goes here.
  \end{presentationframe}
\end{document}
```

Compile with: `lualatex main.tex`

Thank You!
